

Optional pack

All our cabins offer the best of Italian design

- The smartest configuration for your soundproof booth
- Designed to perform Free Field test in a wide selection of booths
- Includes a package of optionals that enhance the booth

Product conforms with directive EEC/93/42
regarding class I medical devices

Technical specification

Free Field Configuration is a full set up of optionals which help to connect the soundproof booth with the equipments required to perform the Free Field test. Designed for different lines of booths and several dimensions. This package includes important elements that enhance the booth and provide added value to the product. In the below table we present different solutions for frontal free field test (speakers at 45°), diagonal free field test (90°), lateral free field test (180°) with patient head at 1 mt. distance from the speakers.

Air Ventilation System

Since Free Field test requires more time to be performed, the air exchange inside the cabin is guaranteed by a silent forced ventilation system mounted on top of the booth. On PRO45S* line air ventilation is already included.

Ramps for easy access

No hurdles to enter the booth. Ramps allow easy access to wheelchairs too.

Internal Power socket(s)

Power sockets connecting speakers and instruments.

External Folding table

Space-saver solution as support for external instruments.

Supports for speakers

Predisposition for speakers inside the booth, provided in DIY kit for self and customized installation (only for PRO 30 and PRO 35F line).

Availability and applications
